**The End Environmental Externalities Manifesto:  
A Rights-Based Foundation for the Next Fifty Years of Environmental Law**

E. Donald Elliott\* and Daniel C. Esty\*\*

\* Professor (Adjunct) of Law, Yale Law School and Distinguished Adjunct Professor, Antonin Scalia Law School, George Mason University. Assistant Administrator and General Counsel, Environmental Protection Agency (1989-91).

\*\* Hillhouse Professor of Environmental Law and Policy, Yale University. Special Assistant to EPA Administrator William Reilly (1989-90); EPA Deputy Chief of Staff (1990-91); EPA Deputy Assistant Administrator for Policy (1991-93).

Both of us had the privilege of serving in government with Dick Stewart when he was the Assistant Attorney General for the Environment and Natural Resources Division of the U.S. Department of Justice, and we served at his client, the Environmental Protection Agency. Before that, we both knew and respected Dick's work as an academic and environmental policy thought leader. We regard him as a mentor, an inspiration, and a model for our own careers. He is also a good friend.

In this article, we attempt to extend Dick's path-breaking work with Bruce Ackerman, who is also a mentor to both of us, on market-based solutions to environmental problems.<sup>1</sup> And like all of those who look at law through the prism of the incentives that it creates, we are further indebted to our teacher, Dean (now Judge) Guido Calabresi.<sup>2</sup> We had the challenge – and

---

<sup>1</sup> See, e.g., Bruce A. Ackerman & Richard B. Stewart, *Reforming Environmental Law*, 37 STAN. L. REV. 1333 (1985); Richard B. Stewart, *Economics, Environment, and the Limits of Legal Control*, 9 HARV. ENVTL L. REV. 1 (1985).

<sup>2</sup> In particular, we acknowledge the influence of his seminal article: Guido Calabresi & Douglas Melamed, *Property Rules, Liability Rules, and Inalienability: One View of the Cathedral*, 85 HARV. L. REV. 1089 (1972). Our approach to internalizing environmental externalities extends the Calabresi & Melamed's framework, which some have called a "pliability rule." See Abraham Bell and Gideon Parchomovsky, *Pliability Rules*, 101 MICH. L. REV. 1 (2003), [https://scholarship.law.upenn.edu/faculty\\_scholarship/1341](https://scholarship.law.upenn.edu/faculty_scholarship/1341) (blending property and liability principles). As is

opportunity – to try to implement some of their ideas in practice when we served at EPA in the late 1980s and early 1990s, most notably when we participated in the drafting and early implementation of the Acid Rain Trading Program under the 1990 amendments to the Clean Air Act. This article reflects some of what we learned from that experience and what we regard as its implications for the future of environmental law.

Developing cost-effective ways to reduce obvious pollution, as Dick Stewart and other intellectual leaders of his generation did, made great sense for first fifty years of America’s modern efforts to protect the environment. Their approach delivered the low-hanging fruit, and environmental conditions across America are much better today as a result. We believe, however, that the challenge for the next generation is to extend their work by addressing the remaining environmental externalities that are neither obvious nor easy to address – and to do so, we need to reframe environmental law and policy on an intellectual foundation of environmental rights rather than economic efficiency.

In Part I, we introduce our call for an “end to externalities” centered on a societal goal of eliminating pollution with an added requirement that emitters pay compensation for any residual emissions that remain after technologically feasible<sup>3</sup> pollution controls have been implemented. We also critique the existing American framework of environmental protection which builds on benefit-cost analysis grounded in the Kaldor–Hicks principle of economic efficiency, and we explain the logic for our alternative rights-based approach. In Part II, we develop the philosophical underpinnings for the *end to externalities principle* – highlighting the need to

---

[described in more detail in the text that follows](#), we argue that people should have an entitlement – protected by a property rule – not to be adversely affected by pollution or other environmental externalities. In our framework, however, this property right is not absolute because compensation to internalize externalities would be paid where it is deemed not feasible to eliminate pollution harms.

<sup>3</sup> As we discuss in more detail in below, we propose that *technological feasibility* be defined not simply as currently cost-effective but rather with reference to technological possibilities that could be achieved with a commitment to zero emissions.

ground environmental law and policy on the economic theories of A.C. Pigou rather than Ronald Coase. In Part III, we spell out the three core elements of the the end of externalities approach and address several fundamental implementation issues. In Part IV, we illustrate the way our revised approach to environmental law might work in practice. In Part V, we offer concluding thoughts and an agenda for further work to restructure environmental law in line with our proposed *end to externalities* strategy.

### **I. Moving from the Kaldor-Hicks Fallacy to the End of Externalities.**

Our central idea is that for the next phase of the environmental law revolution, the goal of environmental *protection efforts* should be to internalize *all* environmental externalities – which for simplicity’s sake we dub the “end to externalities” approach. Environmental externalities include, most prominently but not exclusively, pollution involving releases to the environment that expose other people or ecological resources used by people to harm or the risk of harm without their informed consent.<sup>4</sup> But there are also other types of environmental externalities, such as clear-cutting a rain forest that acts as a carbon sink and a biodiversity reserve.<sup>5</sup> Technically, the climate change and biodiversity impacts from such timbering involve terminating positive externalities that benefit others as well as the owners of the resource. As a general matter, we are inclined to believe that beneficiaries of such positive spillovers should

---

<sup>4</sup> We recognize that our vision is anthropocentric. Others might go farther and claim nature itself has the right to be protected against harm from humans. *See, e.g.*, DOUGLAS A. KYSAR, REGULATING FROM NOWHERE: ENVIRONMENTAL LAW AND THE SEARCH FOR OBJECTIVITY (2010) (arguing in favor of ethical obligations to protect other species in environmental law); CHRISTOPHER D. STONE, SHOULD TREES HAVE STANDING? LAW, MORALITY, AND THE ENVIRONMENT (3rd ed. 2010); ALDO LEOPOLD, A SAND COUNTY ALMANAC: AND SKETCHES HERE AND THERE (1949).

<sup>5</sup> To this list, we might also add the consumption or use of shared public resources such as water pumped for irrigation, timber cutting, livestock grazing, mining, or oil/gas extraction on government lands. While these impacts share with pollution the conceptual structure of private gain at public expense – and thus should be addressed with a similar pricing mechanism that requires the resource users to pay full market value for the timber, fossil fuels, or water they extract – we focus in this article on pollution as the quintessential negative externality. *See, e.g.*, Tom Udall and Chuck Grassley, *End the Taxpayer Giveaway to Big Oil and Gas*, N.Y. TIMES, December 2, 2020 (arguing for market pricing of all resource extraction on federal lands).

fairly compensate land owners to the extent feasible, but such a principle raises a slew of practical problems that are outside the scope of this article. Instead, we focus here on negative environmental externalities.

At least one U.S. environmental statute announces the ambitious goal of eliminating environmental externalities regarding water pollution. The Clean Water Act creates a “National Pollution Discharge *Elimination* System”<sup>6</sup> and boldly envisions the day when none of the navigable surface waters of the United States will be used for waste disposal.<sup>7</sup> With some justification, that goal has been criticized as unrealistic.<sup>8</sup> We agree with the Clean Water Act’s aspirational goal, but we also recognize that practical constraints on the application of the principle of eliminating all pollution must be accepted due to the limits of technology and political realities.

In our view, however, environmental law at this point in history should seek to end all harmful emissions – and where that goal is not technologically feasible, to ensure that the resulting harms are fully paid for by the polluter as a second-best solution. We propose these goals as a matter of justice, not economic efficiency, but we recognize that our zero-emissions goal must be tempered by practicality.

Our *end of externalities* framework therefore seeks to make zero emissions the presumptive goal of environmental law and policy. But we recognize that due to the limits of technology some polluting activities that provide significant benefits to society would be hard to continue without some residual pollution. In that case, we propose that emissions be reduced to

---

<sup>6</sup> 33 U.S.C. § 1342 (emphasis added).

<sup>7</sup> *Id.* § 1251(a)(1) (“It is the national goal that the discharge of pollutants into the navigable waters be eliminated by 1985.”).

<sup>8</sup> BRUCE A. ACKERMAN, SUSAN ROSE-ACKERMAN, JAMES W. SAWYER, JR., & DALE W. HENDERSON, *THE UNCERTAIN SEARCH FOR ENVIRONMENTAL QUALITY* (1974).

the greatest extent *technologically feasible*, which we define with reference not simply to existing “best available technology” but rather to what might be possible with an assiduous commitment to innovation.<sup>9</sup> This framing seeks, on the one hand, to avoid having society lose access to goods with significant benefits, such as cement, from industries where achieving zero emissions might be extraordinarily costly or even impossible. On the other hand, we wish to avoid the inertia of the status quo or any assumption that things have to remain the way they are. In this regard, our requirement that all residual pollution bear a harm charge that compensates as fully as is possible those subject to the ongoing emissions aims to spur attention to the possibilities of breakthroughs that move ever closer to the zero emissions goal. This obligation to pay *full compensation*, as defined in the footnote,<sup>10</sup> is intended to avoid companies simply paying for their harms as a cost of doing business without trying seriously to reach the zero emissions goal.<sup>11</sup>

#### **A. Natural Law Right to a Healthy Environment.**

We believe that everyone living in a community has a legal right, recognized both as a matter of natural right and positive law, to be free from avoidable interferences with their bodily integrity and that this in turn implies that they have a right to a healthy environment. In advancing a rights-based foundation for the next fifty years of environmental law, we build on the common law doctrine that natural resources are held as a public trust for the benefit of the

---

<sup>9</sup> See *supra* note 3.

<sup>10</sup> We acknowledge that no monetary payment can fully compensate someone for injuries to his or her health, or the health of those they love. We use the term “full compensation” as a shorthand for a generous payment that is intended to be sufficient to eliminate the temptation for polluters to pay harm charges rather than reduce or eliminate pollution. We leave the details of exactly how such harm charges would be set and assessed to another day.

<sup>11</sup> We believe that this potential loophole, highlighted for us by Yale Law School Dean Heather Gerken, can be closed and the incentive for innovation leading over time toward zero harmful emissions maintained by a rigorous commitment to pricing the remaining externalities generously and ensuring that harm charges are paid and the victims of ongoing pollution compensated as fully as is possible. This proposal raises questions about what constitutes *full compensation*, issues we take up in a preliminary fashion in Part III.

nation as a whole.<sup>12</sup> We further note that the first modern environmental statute in the United States, the National Environmental Policy Act (NEPA),<sup>13</sup> enacted as national policy that: “The Congress recognizes that each person should enjoy a healthful environment and that each person has a responsibility to contribute to the preservation and enhancement of the environment.”<sup>14</sup> We believe that the use of the word *recognizes* was significant. By recognizing rather than declaring this right, Congress acknowledged a pre-existing natural law right for all Americans to be free from unhealthy environmental conditions created by others without their consent. We describe the philosophical underpinnings of this natural law right below in Section II.B.

Elsewhere we have noted that these statements of national policy in NEPA “have become virtual ‘dead letters’ . . . probably because they were not backed up by a strong enforcement mechanism.”<sup>15</sup> Perhaps this outcome reflects the political reality that limited the reach of the first generation and even the second generation of modern American environmental law through the early 21<sup>st</sup> Century.<sup>16</sup> But the fact that environmental rights were *recognized* but not fully secured has resulted in measurable but incomplete progress<sup>17</sup> toward the national goal declared in NEPA of ensuring every American a healthful environment. We believe that it is now time to extend the work of environmental pioneers such as Dick Stewart by taking on the remaining job

<sup>13</sup> Pub.L. 91–190, 42 U.S.C. § 4321 *et seq.* Although its official title is the National Environmental Policy Act of 1969, it was not actually signed into law by President Nixon until January 1, 1970.

<sup>14</sup> 42 U.S.C. §4331(c), <https://www.law.cornell.edu/uscode/text/42/4331>.

<sup>15</sup> E. DONALD ELLIOTT & DANIEL C. ESTY, *ADVANCED INTRODUCTION TO U.S. ENVIRONMENTAL LAW*, Chapter 14 (London: Elgar, forthcoming 2021).

<sup>16</sup> The principal drafter of the Clean Water Act’s aspirational goal of eliminating water pollution, the late Leon Billings, confided in one of the authors that setting this as a long term goal was as much as he thought he could get politically.

<sup>17</sup> See E. Donald Elliott, *A Critical Assessment of the EPA’s Air Program at Fifty and a Suggestion for How It Might Do Even Better*, 70 CASE W. RES. L. REV. 895 (2020) Available at: <https://scholarlycommons.law.case.edu/caselrev/vol70/iss4/6> (describing measurable but incomplete progress in eliminating air pollution).

of eliminating or internalizing *all* environmental externalities that cause harm to others. We see this ambitious goal as consistent with evolving societal mores and continuing public concern about environmental degradation.

We acknowledge that this reframing of the foundations of environmental law will not be easy and that concessions to practicality and feasibility will need to be made. But we think such concessions will be required today to a much lesser extent than was required of our predecessors. We recognize furthermore that the rights we seek to vindicate are not absolute. If, for example, our duly-constituted lawmaking institutions decide to set aside some portion of the waters of the United States for use as sewers, that policy decision should be accepted as within their purview. But we would insist that policy-makers charge all polluters or natural resource users (including governments) fees to compensate the public for the fair value of their use of resources in common ownership.<sup>18</sup>

Evidence of the emerging public belief in the importance of environmental rights and a principle of no negative externalities can be found in many places, both in the United States and around the world. Opinion surveys show Americans across party lines and other divides wanting stronger environmental protection.<sup>19</sup> And more than 100 nations have elaborated environmental rights in their constitutions.<sup>20</sup> Perhaps even more notably, business leaders have increasingly come to accept the need for companies to address their negative effects on society and not simply

---

<sup>18</sup> Bruce A. Ackerman & E. Donald Elliott, *Air Pollution "Rights,"* N.Y. TIMES, Sept. 11, 1982, at 23 (“The E.P.A. should, instead, sell polluters the right to dirty the air for a fixed period—just as the Government now auctions off oil and gas leases to the highest bidders. If polluters were forced to pay, they would clean up to avoid the cost—and breathers, not industry, would profit. The public would not stand for a multi-billion dollar give-away of public lands or water to industry. Why should the air be different?”).

to seek to optimize profits. For example, the Business Roundtable, representing several hundred CEOs of America’s leading companies, recently updated its vision of corporate purpose, declaring that the era of *shareholder primacy* had ended and that corporations must take up a broader mission of *shareholder responsibility* that extends a duty of care to the enterprises’ workers, customers, suppliers, communities, and society in general.<sup>21</sup> Some companies, such as Interface Carpet, have gone even further and expressly adopted a “no negative impacts” on society goal – which parallels our proposed end of externalities principle.<sup>22</sup> And more than 1000 companies – including Amazon, Apple, Ford, McDonalds, Microsoft, and even major energy sector companies such as BP, Shell, and Total – have made commitments to net-zero greenhouse gas emissions by 2050.<sup>23</sup>

## **B. The Kaldor–Hicks Fallacy.**

Policy decisions to tolerate certain levels of pollution are not the main reasons why we as a country have been unable to date to eliminate all harmful environmental externalities and have come instead to accept significant levels of ongoing emissions.<sup>24</sup> We believe the primary culprit has been the emergence of a dominant vision of environmental policy based on benefit-cost analysis rather than the right to a healthy environment.<sup>25</sup> This alternative vision limits our

environmental aspirations by holding that government should only regulate if it is prepared to prove that a regulatory measure is scientifically justified and would produce “net social benefits.”<sup>26</sup>

This prevailing benefit-cost framework settles for the Kaldor–Hicks criterion of economic efficiency as opposed to the more demanding goal of Pareto Superiority. The Kaldor–Hicks principle holds that a change of policy is desirable if the winners benefit sufficiently that they *could* compensate the losers, even if they do not actually pay compensation, whereas Pareto Superiority requires that someone is made better off but without making anyone worse off.<sup>27</sup> The Kaldor–Hicks approach, which allows some to be made worse off if others benefit more became national policy through the *net social benefit* standard for new rules under the Reagan Administration’s Executive Order 12291.<sup>28</sup> That executive order created review of proposed major rules by the Office of Information and Regulatory Affairs (OIRA), and embedded benefit-cost analysis and risk assessment in the regulatory process. These concepts still dominate most of the thinking in environmental policy today despite changes in language in subsequent executive orders.<sup>29</sup> However, we maintain that the “cost-benefit state” is merely a transitional stage in the development of environmental law, not its final culmination.<sup>30</sup>

---

FUTURE OF REGULATORY PROTECTION (Aba Sec. Of Admin. L. & Reg. Prac. Ed., 2002) (noting that “government regulation is increasingly assessed by asking whether the benefits of regulation justify the costs of regulation.”).

<sup>26</sup> See, e.g., Exec. Order 12291 (1981).

<sup>27</sup> For a short explanation, see *Kaldor–Hicks efficiency*, OXFORD REFERENCE, <https://www.oxfordreference.com/view/10.1093/oi/authority.20110803100028833#:~:text=Quick%20Reference,one%20is%20made%20worse%20off>. See also Stephani H. Jones, Note, *Greater than the Sum of its Parts: The Integration of Environmental Justice Advocacy and Economic Policy Analysis*, 26 N.Y.U. ENV’T L.J. 402, 419 (2018) (defining the Kaldor–Hicks criterion) (citing NICHOLAS A. ASHFORD & CHARLES C. CALDART, ENVIRONMENTAL LAW, POLICY, AND ECONOMICS 162 (2008) (“If the net effects of a government policy are positive, then those who gain as a result of the policy could, in theory, pay off those who lose and still have some benefits left over for themselves. Potentially, no one loses and at least some gain.”)).

<sup>28</sup> Exec. Order 12291, 3 C.F.R. (1981).

<sup>29</sup> See generally SUNSTEIN, *supra* note 23.

<sup>30</sup> Compare FRANCIS FUKUYAMA THE END OF HISTORY AND THE LAST MAN (1992)(arguing that liberal democracy and free markets are not merely a particular stage in history, but the end of history in the sense of being the final end-point of mankind's ideological evolution).

Under today's prevailing framework, a polluter sending emissions up a smokestack may make others worse off as long as the polluting enterprise gains more than the breathers are hurt. For example, the employment benefits to a community may be seen as sufficient to justify modest harms to the health of the workers and neighbors. This outcome passes the Kaldor–Hicks and net-benefits tests, but would not be Pareto superior because some are made worse off. Under our *end of externalities* principle, the polluting facility would be required to stop the emissions or compensate fully the affected workers and neighbors.

While benefit-cost analysis may be useful in setting priorities and for choosing among alternative remedies,<sup>31</sup> in our view, it is a mistake to use benefit-cost analysis to limit our national commitment to internalizing environmental externalities. The problem is not merely measurement, which is a critique of benefit-cost analysis that some academics make.<sup>32</sup> Our *primary* concern is rather the more fundamental one that using benefit-cost comparisons to allow harm to health to continue or increase presumes that harming the health of others is permissible as long as the benefits from doing so are greater than the harms. We do not agree, for example, that a polluting chemical plant should be allowed to adversely affect the health of its neighbors merely because it would cost the company more to eliminate its discharges than the measurable benefits from eliminating the discharges to those who live near the facility. We call the reigning social net-benefit regulatory criterion with which we disagree (because it allows significant emissions that harm others to go uninternalized) the *Kaldor–Hicks Fallacy*.<sup>33</sup>

---

<sup>31</sup> E. Donald Elliott, *Only a Poor Workman Blames His Tools: On Uses and Abuses of Benefit-Cost Analysis in Regulatory Decision Making About the Environment*, 157 U. PA. L. REV., 178 (2009), <http://ssrn.com/abstract=1712326>.

<sup>32</sup> See, e.g. FRANK ACKERMAN AND LISA HEINZERLING, PRICELESS: ON KNOWING THE PRICE OF EVERYTHING AND THE VALUE OF NOTHING (2004).

<sup>33</sup> To be clear, we do not argue with Kaldor–Hicks as a way to assess economic efficiency. We maintain, however, that maximizing economic efficiency is not the right way to frame environmental law nor is it sufficient to vindicate environmental rights as we discuss below.

### C. Compensation Alternative to Internalize Externalities.

While our *end to externalities* principle is indeed a proposal to change the basic paradigm underlying environmental law away from the Kaldor–Hicks Fallacy, our approach should not be seen as a total break with the past. Indeed, Congress has sometimes articulated principles similar to ours but only in limited areas and not on a consistent or coherent basis. For example, the 1990 amendments to the air toxics provisions of the Clean Air Act specifically prohibited benefit-cost analysis and required sources of hazardous air pollutants to install maximum-achievable control technology to protect health regardless of whether it was cost-justified.<sup>34</sup>

We do, however, go farther than Congress did in that we believe that the law should require *actual compensation* to those injured by the residual risks that remain after the application of whatever level of pollution control technologies are deemed economically feasible.<sup>35</sup> While environmental lawyers often talk about the *polluter-pays principle*,<sup>36</sup> the actual regulatory practice, at least in the United States, has gradually devolved into a polluter does *not* pay principle – with significant residual emissions literally “permitted” under government regulation.<sup>37</sup>

As we indicated above, our main objection to the prevailing Kaldor–Hicks standard is that it merely requires that the beneficiaries of a government decision *could* pay compensation, not that they actually do so. Additionally, we also worry that many of benefits of pollution reductions in improving health and welfare of citizens and ecosystems may not be fully counted

---

<sup>34</sup> 42 U.S.C. §7412.

<sup>35</sup> Cf. *Boomer v. Atlantic Cement Co.*, 26 N.Y.2d 219, 309 N.Y.S.2d 312 (N.Y. 1970) (allowing polluting plant to continue to operate upon condition of paying compensation in private nuisance case).

<sup>36</sup> *What is the Polluter Pays Principle?*, GRANTHAM RESEARCH INSTITUTE ON CLIMATE CHANGE AND THE ENVIRONMENT (May, 2018), <https://www.lse.ac.uk/granthaminstitute/explainers/what-is-the-polluter-pays-principle/#:~:text=The%20polluter%20pays%20principle%20is,health%20or%20the%20environment.&text=This%20principle%20underpins%20most%20of,air>

<sup>37</sup> See, e.g. *supra* note 18.

in benefit-cost analysis because they are diffuse and difficult to measure.<sup>38</sup> On the other hand, pollution control costs are often concentrated on industries that are very well positioned to calculate the economic burden they face from abatement rules and to ensure that regulators and elected officials appreciate these costs and related economic consequences such as diminished competitiveness, lower economic growth, and job losses. Thus, we think the obligation to measure harms and pay compensation may, in fact, reveal more circumstances in which the polluting enterprise does not meet even the net social benefit test, much less our more demanding standard.

Under our proposed new *no uninternalized externalities* principle, a factory that is harming its neighbors, even if it is producing net social benefits, would be obligated to reduce or eliminate its emissions to the fullest extent possible with reasonably foreseeable technology. If the facility were generating net social benefits but could not eliminate its pollution entirely, it would be required to reduce the harm as much as is feasible and pay compensation to the victims for harm that remains. We see the additional compensation obligation as essential to internalize the externality, create proper incentives for pollution control innovation, and compensate victims for the violation of their right to a healthy environment.

We note that our proposed approach parallels the compromise that society has reached in allowing workers to engage in hazardous activities if their companies produce net social benefits, but requiring their employers to reduce the risks as much as is feasible and to pay compensation to workers for the harms that do occur<sup>39</sup> as well as to disclose the nature and extent of the health

---

<sup>38</sup> See generally Al McGartland et al., *Estimating the Health Benefits of Environmental Regulations*, 357 SCIENCE 457 (2017) (addressing the scientific uncertainties involved with quantifying the benefit of pollutant regulation).

<sup>39</sup> See generally *Industrial Union Dept., AFL-CIO v. American Petroleum Inst.*, 448 U.S. 607, 639–59 (1980) (construing OSHA to apply only “significant” risks to health because the Court will not presume Congress intended to protect workers by putting their employers out of business), <https://supreme.justia.com/cases/federal/us/448/607/>

hazards.<sup>40</sup> Unlike the general population, workers consent to their exposures, although their consent may be tainted by their need for a job. We think that the general population should be entitled to at least the same types of feasible controls, disclosure and no-fault compensation that we offer to workers through the workers compensation and OSHA systems.

#### **D. Advancing Environmental Justice**

Because the hidden costs of pollution tend to fall more heavily on minority and low-income communities,<sup>41</sup> an important side benefit of our end to externalities principle would be a major boost to the environmental justice agenda.<sup>42</sup> Indeed, we believe that our proposed requirement for *actual payments to victims* would do more to advance environmental justice than all of the existing declarations, executive orders, and other policy mechanisms that merely require consideration of disproportionate impacts on people of color or other disadvantaged communities.<sup>43</sup>

If it is not practical to identify specific people who are exposed to environmental risks, then compensation should be paid to their communities or through appropriate “supplemental environmental projects.”<sup>44</sup> For broad-based harms that cannot be traced to specific communities,

Timmons Roberts, *Environmental Justice*, 34 ANNUAL REVIEW OF ENVIRONMENT AND RESOURCES 1, 405-430 (2009), <https://doi.org/10.1146/annurev-environ-082508-094348>.

<sup>43</sup> See, e.g. Exec. Order 12898, 3 U.S.C. (1994); COUNCIL ON ENV'T QUALITY, ENV'T JUSTICE: GUIDANCE UNDER THE NATIONAL ENVIRONMENTAL POLICY ACT 10 (1997) (instructing agencies to consider environmental justice at various stages of NEPA analysis).

<sup>44</sup> For an explanation of “supplemental environmental projects,” which are a common feature of environmental enforcement settlements, see *Supplemental Environmental Projects (SEPs)*, EPA, <https://www.epa.gov/enforcement/supplemental-environmental-projects-seps>

the compensation should be paid to the government entity that most closely tracks the geographic scope of the emissions,<sup>45</sup> which might be either a state or the federal government – with compensation for harms that are global in scope retained by the national government unless it has agreed to some other payment structure.<sup>46</sup> For current activities that may be anticipated to harm future generations (such as so-called “forever chemicals” that never break down in the environment), user fees can be paid into a trust that is set aside to respond to the problem in the future. Something like that is currently done under a few environmental laws, primarily those that require a mine or other extractive activity to accumulate funds or post financial assurance during its operating life to pay for end-of-life expenses such as land restoration.<sup>47</sup>

Charging polluters user fees makes sense not only as a matter of compensatory justice, but also to create incentives to develop better production processes as well as better pollution controls in the future.<sup>48</sup> We believe that EPA has existing authority to charge user fees for pollution under the 1952 Independent Offices Appropriations Act,<sup>49</sup> as many other government agencies already do to the tune of over \$64 billion a year for access to resources they control.<sup>50</sup>

---

<sup>45</sup> This proposal builds on Butler and Macey’s famous “matching principle” for addressing externalities. Henry N. Butler & Jonathan R. Macey, *Externalities and the Matching Principle: The Case for Reallocating Environmental Regulatory Authority*, 14 YALE L. & POL’Y REV. (1996).

<sup>46</sup> One could imagine a future moment where nations might agree that compensation for residual greenhouse gas emissions should be paid into the Green Climate Fund or the Global Environment Facility (GEF). Such an outcome would follow the Butler–Macey matching principle, *supra* note 45, and be seen as consistent with calls for “climate justice.” However, in view of current realities of national sovereignty, such a payment structure would only make sense as part of the give-and-take of ongoing climate negotiations.

<sup>47</sup> For example, the Surface Mining Control and Reclamation Act (SMCRA) of 1977 created the Abandoned Mine Land (AML) Reclamation Program. Coal companies currently operating strip mines pay into a fund to support future abandoned mine reclamation.

<sup>50</sup> E. Donald Elliott, *EPA’s Existing Authority to Impose a Carbon “Tax”*, 49 ENVTL L. REP. 10919 (Oct., 2019), <https://elr.info/news-analysis/49/10919/epas-existing-authority-impose-carbon-tax>. The U.S. Government

In addition, litigation is being used increasingly by environmental advocacy groups to try to hold polluters responsible for monetary damages for the harms their pollution causes, although with only limited success to date in the United States.<sup>51</sup>

The harms from pollution are not only physical but also psychological due to the fear engendered when people and their children are exposed to substances involuntarily and worry about how this exposure may harm their health. To internalize this portion of the externality, when significant releases to the environment occur, but it is not yet clear whether they are harmful, polluters should be required to disclose not only the extent of the releases, but also their basis for concluding that the releases will not harm others. To reduce transaction costs, disclosure and compensation could be required through an expansion of the existing permitting process to include no fault compensation payments for psychological as well as physical harms from the level of pollution that a permit allows to continue. In some cases, a review of the

---

Accountability Office (GAO) found that 23 federal agencies collected nearly \$64 billion in fiscal year 2010 from over 3,600 user fees. U.S. GOVERNMENT ACCOUNTABILITY OFFICE, 2012 ANNUAL REPORT: OPPORTUNITIES TO REDUCE DUPLICATION, OVERLAP AND FRAGMENTATION, ACHIEVE SAVINGS, AND ENHANCE REVENUE 278-79 (2012) (GAO-12-342SP), available at <https://www.gao.gov/assets/590/588818.pdf>.

<sup>51</sup> For example, the Earth Island Institute recently filed suit seeking compensatory damages as well as the costs of clean-up against ten major users of disposable plastics that litter beaches. *Earth Island Institute v. Crystal Geyster Water Co. et al.*, No. 20 CIV01213 (Cal. Sup. Ct. San Mateo, 2020), [https://www.earthisland.org/images/uploads/suits/2020-02-26\\_Earth\\_Island\\_Complaint\\_FILED.PDF](https://www.earthisland.org/images/uploads/suits/2020-02-26_Earth_Island_Complaint_FILED.PDF). But in other nations, courts have moved more aggressively to hold polluters accountable for harms including greenhouse gas emissions. The *Urgenda* in the Netherlands offers a prominent recent example of this trend, Hof's-Gravenhage 9 oktober 2018, AB 2018, 417 m.nt. GA van der Veen, Ch.W. Backes (Staat der Nederlanden/Stichting Urgenda); courts in France, Ecuador, Columbia, Pakistan, Britain, Nigeria, and the Philippines have similarly issued decisions in recent years holding parties accountable for violating environmental rights. *See, e.g.*, Conseil d'Etat [Council of State] Nov. 19, 2020, No. 427301 (Fr.), available at <https://www.conseil-etat.fr/actualites/actualites/emissions-de-gaz-a-effet-de-serre-le-gouvernement-doit-justifier-sous-3-mois-que-la-trajectoire-de-reduction-a-horizon-2030-pourra-etre-respectee>; Colombia Supreme Court of Justice Ruling 4360 of 2018; Colombia Constitutional Court Ruling T-622 of 2016, Expediente T-5.016.242; Leghari v. Fed'n of Pakistan, (2015) W.P. No.25501 (HC Lahore) (Pak.); Mbabazi and Others v. The Attorney General and National Environmental Management Authority, Civil Suit No. 283 of 2012 (Uganda); *see generally* Daniel C. Esty, *Toward a Sustainable Future: Environmental Jurisprudence from France's Constitutional Council Breaks New Ground*, in FRENCH CONSTITUTIONAL COUNCIL: ANNUAL REPORT 2020 106, 107 (2020).

existing scientific literature may be sufficient to come to a “no harm” conclusion.<sup>52</sup> But if such a review cannot provide the necessary foundation for a “no harm” judgment, then we believe that the polluter should have a legal obligation to hire competent independent experts to conduct original research into whether their pollution will harm others before releasing it into the environment.<sup>53</sup> This is similar to the existing system of “hazard communication” that applies to workers which requires employers to provide objective information about the extent of risks to which their employees are exposed on the job.<sup>54</sup>

We note, moreover, that one reason that proposals to track emissions, charge for harms, and pay compensation to victims were not considered as parts of America’s modern framework of environmental law of the 1970s and 1980s can be traced to the perceived need to pursue strategies that were easier to manage administratively. But today’s information technologies, Big Data analytics, and communications links make the challenge of charging for harms more manageable and likely to be lower in cost than in the 1970s.<sup>55</sup>

## **II. Philosophical Basis for the Goal of Eliminating Harm**

### **A. Why Internalize Externalities?**

Our central thesis that environmental law should strive to eliminate all environmental externalities harkens back to British economist Arthur Cecil Pigou. In his 1920 book *The*

---

<sup>52</sup> See E Donald Elliott and Gail Charnley Elliott, *Private Product-Risk Assessment and the Role of Government*, 23 JOHN LINER REV. 73 (2009), [https://papers.ssrn.com/sol3/papers.cfm?abstract\\_id=1712323](https://papers.ssrn.com/sol3/papers.cfm?abstract_id=1712323) (describing reliance on existing scientific literature by companies doing due diligence before introducing a new product).

<sup>53</sup> Such an obligation would reverse the burden of proof to demonstrate emissions safety, putting that burden on the enterprise involved rather than the government. In doing so, it follows the models of California’s Proposition 65 regarding toxic risks and the European Union’s REACH Directive. See Carl Cranor, *Information Generation and Use Under Proposition 65: Model Provisions for Other Postmarket Laws?* 83 INDIANA L. J. 609, 610 (2008); Ellen K. Silbergeld et al., *Regulating Chemicals: Law, Science, and the Unbearable Burdens of Regulation*, 36 ANNUAL REV. PUB. HEALTH 175 (March 2015).

<sup>54</sup> See OSHA Standard 1910.1200 - Hazard Communication. <https://www.osha.gov/laws-regs/regulations/standardnumber/1910/1910.1200>.

<sup>55</sup> Daniel C. Esty, *Environmental Protection in the Information Age*, 79 NYU L. REV. 1, 56-67 (2004).

*Economics of Welfare*, Pigou argued that the mere existence of “negative externalities” offers a valid reason for regulation and should be so recognized in law.<sup>56</sup> We agree with Pigou that the goal of environmental law should be to internalize negative externalities – at least if they are beyond *de minimis* discharges<sup>57</sup> and to the maximum extent practicable. Thus, we argue here for an end to externalities through the imposition of “harm charges” and information disclosure commensurate with the negative effect of any externality that is allowed to continue due to practical considerations.<sup>58</sup>

In our view, environmental law (at least in the academy) took a wrong turn by carrying the lessons of Ronald Coase too far and turning its back on Pigou. Coase famously asserted that, in the absence of transaction costs, regardless of whether farmers or ranchers received rights at law, the same level of fencing to keep cows out of the cornfield next door would be built.<sup>59</sup> Importantly, in Coase’s example, both parties have equally valid interests and the “harm” that results is merely the fact that their interests conflict. In addition, Coase was discussing an imaginary world without transaction costs and devoted to economic efficiency, not justice. In the

---

<sup>56</sup> See generally ARTHUR PIGOU, *THE ECONOMICS OF WELFARE* (1920).

<sup>57</sup> An example of a *de minimis* discharge is one that does not exceed the assimilative capacity of the environment and thus may result in no harm. See *Assimilative capacity*, ENCYCLOPEDIA.COM, <https://www.encyclopedia.com/environment/encyclopedias-almanacs-transcripts-and-maps/assimilative-capacity>. However, how to allocate the limited assimilative capacity of environmental resources among competing users raises difficult issues of equity that are beyond the scope of the current paper. See Robert U. Ayres & Allen V. Kneese, *Production, Consumption, and Externalities*, 59 THE AMERICAN ECONOMIC REVIEW 3, 282-297 (1969), <https://www.jstor.org/stable/pdf/1808958.pdf> (“[U]nder conditions of intensive economic and population development the environmental media which can receive and assimilate residual wastes are not free goods but natural resources of great value with respect to which voluntary exchange cannot operate because of their common property characteristics.”).

<sup>58</sup> Esty, *supra* note 48, at 24–25 (arguing for an end to externalities as a foundational principle for environmental regulation); see also E. Donald Elliott, *A Critical Assessment of the EPA’s Air Program at Fifty and a Suggestion for How It Might Do Even Better*, 70 CASE W. RES. L. REV. 895, 895 (2020) (suggesting EPA charge user fees for air pollution that it allows to continue to create incentives for further reductions); Erin Adele Scharff, *Green Fees: The Challenge of Pricing Externalities Under State Law*, 97 NEB. L. REV. 168 (2018) (discussing similar issues under state law).

<sup>59</sup> Ronald Coase, *The Problem of Social Cost*, 3 J. LAW ECON. 1 (1960).

real world,<sup>60</sup> some harms are not caused equally by both sides in any sense that the law should care about. Is your broken jaw really jointly “caused” by the presence of your jaw at a particular place and time at the moment that my fist comes smashing into it? Perhaps in some metaphysical sense, but that does not stop the law from prosecuting assaults. Similarly, the innate human need to breathe healthy air is not a joint “cause” of air pollution in the same way that a factory using our common air resource for waste disposal is.<sup>61</sup> For all of these reasons, Coase’s insight, valid as it is within limits, does not mean that environmental law should give up on trying to internalize environmental externalities to the maximum extent feasible.

### **B. Toward a Rights-Based Framework of Environmental Law**

For the reasons outlined above, we believe that members of a community owe one another a moral duty not to injure each other, regardless of whether abating a particular injury is economically efficient. The natural law duty for polluters not to injure others creates a correlative right for breathers to be free from harmful pollution,<sup>62</sup> or if abating harmful pollution is infeasible (not merely “inefficient”), for polluters to compensate breathers for their injuries and ameliorate their fears as a second-best solution – and thereby fully “internalize” externalities.<sup>63</sup> However, today U.S. environmental law in practice subsidizes pollution by under-internalizing the harms of pollution that it deems economically inefficient to abate. This

---

<sup>60</sup> The best empirical evidence is that people do not actually behave as predicted by Coase, but rather resort to shared notions of the duties of neighbors not to injure one another. ROBERT C. ELLICKSON, *ORDER WITHOUT LAW: HOW NEIGHBORS SETTLE DISPUTES* (Harvard U.Press, 1991).

<sup>61</sup> If it is more efficient for what environmental law sometimes calls “receptors” (people) rather than polluters to abate a harm, polluters can pay them to do so. For example, at Superfund sites where it is too expensive to clean up the groundwater to drinking water quality, it is common for polluters to pay for alternative water supplies. But this does not mean that the result is “the same” regardless of to whom the law assigns legal rights. The “wealth position” (who pays for the efficient solution) is different depending upon whom the positive law recognizes as the rights holder. In addition, monetary compensation rarely if ever makes someone whole for harm to their health, but it is the best that we can do.

<sup>62</sup> See generally Wesley Hohfeld, *Some Fundamental Legal Conceptions As Applied In Judicial Reasoning* 23 *YALE L.J.* 16, 28–59 (1913) (describing reciprocal relationship of rights and duties).

<sup>63</sup> See *supra* note 2.

efficiency limitation shapes pollution control in a manner similar to the way that the 19<sup>th</sup> century law of industrial accidents, which was designed to be “employer-friendly” and created numerous defenses against liability,<sup>64</sup> subsidized industrial development by giving factory owners broad defenses to avoid paying the costs of workplace injuries.<sup>65</sup> Over time, workers gained greater protection, and compensation for industrial accidents became the norm. We think it is now time for pollution victims to be accorded similar protection, disclosure, and compensation.

### **III. Implementing the End of Externalities Principle**

#### **A. Identifying Negative Environmental Externalities.**

Before we can try to end – or more accurately, “internalize” – negative externalities, we must, of course, be able to recognize and define them. This task proves to be more difficult than it might appear. A surprising degree of confusion emerges from the scholarly literature about exactly what constitutes a negative externality. Most definitions merely consist of a handwave in the direction of imposing “costs” on a third party, and then give pollution as an example. The *Encyclopedia Britannica*, for example, states that

A negative externality exists when the production or consumption of a product results in a cost to a third party. Air and noise pollution are commonly cited examples of negative externalities. When negative externalities are present, private markets will overproduce because the costs of production for the firm are understated and profits are overstated.<sup>66</sup>

Similarly, *Black’s Law Dictionary* tells us that a negative externality “occurs when a product or decision exceeds the society’s private cost” and goes on to note that such circumstances

---

<sup>64</sup> One example is the now abrogated fellow servant rule which exonerated the employer from paying compensation if another employee caused the injury. <https://definitions.uslegal.com/f/fellow-servant-rule/>

<sup>65</sup> LAWRENCE FRIEDMAN, A HISTORY OF AMERICAN LAW 409-27 (1973); MORTON HORWITZ, THE TRANSFORMATION OF AMERICAN LAW, 1780-1860, at 67-108 (1977); Charles O. Gregory, *Trespass to Negligence to Absolute Liability*, 37 VA. L. REV. 359, 368 (1981) (“Judicial subsidies . . . to youthful enterprise removed pressure from the pocket-books of investors and gave incipient industry a chance to experiment on low-cost operations without the risk of losing its reserve in actions by injured employees. Such a policy no doubt seems ruthless; but in a small way it probably helped to establish industry.”)

<sup>66</sup> *Private Good*, ENCYCLOPAEDIA BRITANNICA, <https://www.britannica.com/topic/private-good#ref1189688>.

represent a “market failure.”<sup>67</sup> In a recent article that seeks to give more depth to the issue of “externalities,” economist Bryan Caplan contends that they can be defined as whatever someone would pay to avoid:

Research and development is a standard example of a positive externality, air pollution of a negative externality. Ultimately, however, the distinction is semantic. It is equivalent to say “clean air has positive externalities and so clean air is underproduced” or “dirty air has negative externalities and so dirty air is overproduced.”

Economists measure externalities the same way they measure everything else: according to human beings’ willingness to pay. If one thousand people would pay ten dollars each for cleaner air, there is a ten-thousand-dollar externality of pollution. If no one minds dirty air, conversely, no externality exists. If someone likes dirty air, this unusual person’s willingness to pay for smog must be subtracted from the rest of the population’s willingness to pay to curtail it.<sup>68</sup>

But as “clean air” (whatever that means) is not a commodity traded in markets, how are we to know how much people would be willing to pay for it? Is it really true, moreover, that people ought to have to *pay* to breathe clean air? Or rather aren’t some claims to use the air for certain purposes, such as breathing, more deserving of protection by the law than others, such as using the air for waste disposal? Other areas of law, such as riparian rights for allocating water, traditionally give preference to uses for domestic consumption that are necessary for human self-preservation.<sup>69</sup> And is it really true that whatever people “mind” and would prefer to avoid is an externality? The late President George Herbert Walker Bush famously expressed dislike for

---

<sup>67</sup> *What is NEGATIVE EXTERNALITY?*, BLACK’S LAW DICTIONARY, <https://thelawdictionary.org/negative-externality/>.

REV. 245 (1978), <https://digitalcommons.unl.edu/nlr/vol57/iss2/2> (“The fundamental preferential use developed through the riparian doctrine is classified as “natural,” “ordinary,” or “domestic.” This classification of uses reflects a right of self-preservation and creates in the riparian owner a preference to supply the needs of himself, his family, and his livestock for such purposes as drinking, cooking, and cleansing.”).

broccoli.<sup>70</sup> Does that make broccoli farmers guilty of creating an “externality” that the law should address?

The concept of internalizing externalities is actually a very old principle in the common law, the antecedents of which can be traced back at least to the 1611 decision in *Aldred’s* case, a matter rediscovered and popularized by Dick Stewart’s 1978 environmental casebook with Jim Krier.<sup>71</sup> In that case, a court held that the neighbor of an English pig farmer whose animals were causing a stench that spilled onto his neighbor’s property had a cause of action as a result of the negative externality.<sup>72</sup> And the libertarian tradition goes back farther than Pigou, albeit in different language.

Another Stewart, one who misspelled his middle name – John Stuart Mill – called this the “harm principle”<sup>73</sup> and made it the cornerstone of his philosophy that everyone has the liberty to do what they will if, but only if, their actions do not harm others. This seminal idea has also been elaborated more recently in the ethical theories of philosopher William David Ross that everyone has a *prima facie* duty not to harm others.<sup>74</sup> We argue that this ethical duty not to harm others has important implications for environmental law as we will try to elaborate. John Stuart Mill distinguished between what he called “harms” and “mere offenses.” Not everything that others do not like is a “harm” that the state may rightly prohibit in his philosophical system. “To

constitute a harm, an action must be injurious or set back important interests of particular people, interests in which they have rights.”<sup>75</sup>

The primary “harm” of concern in the field of environmental pollution is impinging upon every person’s fundamental human right to bodily integrity and to a healthy environment that does not harm his or her health.<sup>76</sup> But pollution also produces other cognizable “harms,” such as degrading visibility, adversely affecting ecosystems, threatening the viability of endangered species, and contributing to climate change. Many of these effects also affect non-human species which may or may not be seen as possessing natural law rights against harm. In addition, we face further difficulties in defining externalities by reference to environmental rights that have been infringed because many of these “rights” are held in common by large numbers of people.

Whether some kinds of pollution are or are not actually creating an identifiable “harm” is furthermore often unclear as a matter of science.<sup>77</sup> As a result, one of the key issues to be decided in any system of environmental law is who bears what we call the “*uncertainty risk*.”<sup>78</sup> Notably, should we allow one party – usually, but not always, industry – to continue activities that may be harming others merely because “full scientific certainty”<sup>79</sup> that the behavior is indeed harmful is not yet available?

---

<sup>75</sup> *Supra* note 47.

<sup>76</sup> Note that, since the 1970s, a growing number of national constitutions (although not the U.S. one) recognize a right to a healthy environment in one form or another. See, e.g., David R. Boyd, *The Status of Constitutional Protection for the Environment in Other Nations*, DAVID SUZUKI FOUNDATION, <https://david Suzuki.org/wp-content/uploads/2013/11/status-constitutional-protection-environment-other-nations.pdf>.

<sup>77</sup> See generally Albert C. Lin, *Technology Assessment 2.0 Revamping Our Approach to Emerging Technologies*, 76 BROOKLYN L. REV. 1309 (2011) (detailing the level of uncertainty involved in hazard risk assessments, especially with regard to hazards whose risks involve “unknown unknowns” given technological shortcomings).

<sup>78</sup> Alyson C. Flournoy, *Legislating Inaction: Asking the Wrong Questions in Protective Environmental Decisionmaking*, 15 HARV. ENVTL. L. REV. 327, 366 (1991) (highlighting how absent concrete demonstration of high risk of harm, classical environmental regulations do not regulate potentially harmful conduct).

<sup>79</sup> Commission of the European Communities, *Communication from the Commission on the Precautionary Principle*, COM (2000)1 (Feb. 2, 2000), <https://op.europa.eu/en/publication-detail/-/publication/21676661-a79f-4153-b984-aeb28f07c80a/language-en> (Under the European Union’s “precautionary principle,” the absence of full scientific certainty should not preclude regulation). See generally Robert V. Percival, *Who’s Afraid of the Precautionary Principle*, 23 Pace Env’tl. L. Rev. 21, 25 (2006).

We take the strong view that imposition of a credible “risk of a risk” without someone’s informed consent, not merely provable *actual* injury, should be cognizable as a “harm” that environmental law should address to the extent practical.<sup>80</sup> The difficulty comes in deciding what rebuts the presumption that environmental externalities should be eliminated or internalized and how much weight to give to “practicality.” How much evidence is necessary – and who has a burden to compile it? How much expense may be imposed by the state to obviate what may or may not turn out to be an actual harm to others? We acknowledge those issues but are not yet prepared to answer those questions but leave them for another day.

## **B. Further Implementation Issues**

Our end of externalities framework raises a number of difficult implementation issues, and we try to approach them pragmatically by learning from what has and has not worked in the history of environmental law.

### **1. Precautionary Principle**

We do not take the view that *precaution* should always be adopted by government policy.<sup>81</sup> Rather, there should be a rebuttal presumption that government will require the internalization of externalities – eliminating harm to others to the maximum extent practical and paying full compensation for any residual harms. As noted above, this principle should additionally permit *risk compensation charges* to be imposed on conduct that *may* credibly be harming others even though there is not yet full scientific certainty that it is actually doing so.<sup>82</sup>

---

<sup>80</sup> Albert C. Lin, *The Unifying Rule of Harm in Environmental Law*, 2006 WIS. L. REV. 897, 911 (2006) (“Yet even in risk-based regulation, the law has generally required an affirmative showing that harm is likely before intervening.”). Courts have begun to recognize risk of harm as a cognizable injury conferring constitutional standing to sue. *See, e.g., Massachusetts v. EPA*, 549 U.S. 497 (2007); *Nat. Res. Def. Council v. EPA*, 464 F.3d 1, 6 (D.C. Cir. 2006); *Strubel v. Comenity Bank*, 842 F.3d 181, 189 (2d Cir. 2016).

<sup>81</sup> *But see* sources cited in note 80 *supra* for arguments in favor of erring on the side of precaution.

<sup>82</sup> On compensation for involuntary exposure to risk, *see* E. Donald Elliott, *The Future of Toxic Torts: Of Chemophobia, Risk as a Compensable Injury and Hybrid Compensation Systems*, 25 HOUSTON L. REV. 781 (July, 1988), [https://digitalcommons.law.yale.edu/fss\\_papers/5107/](https://digitalcommons.law.yale.edu/fss_papers/5107/). *See also* Clifford Fisher, *The Role of Causation in*

## 2. What Degree of Pollution Control Should Be Required

Given our starting point – that governments have a presumptive obligation to restrict conduct that imposes cognizable harm on others without their consent – we would generalize the application of the operative standard under one of our nation’s most recent environmental statutes, the Food Quality Protection Act, which declares that members of a community are entitled to “reasonable assurance of no harm” from the actions of others in applying pesticides to their crops.<sup>83</sup> We believe persons subject to exposure to substances released into the environment by others in whatever form are entitled to that same level of protection: “reasonable assurance of no harm.”

In determining what degree of pollution control should be mandated in this regard requires assessments of technological feasibility, innovation possibility, and economic practicality. We envision that the existing EPA would be well positioned to develop such *feasibility standards* building on its current engineering and industrial technology capabilities. We believe, furthermore, that the regulated community would be strongly incentivized to collaborate with this exercise in standard setting, knowing that any amount of pollution left unabated will bear an unavoidable harm charge.

## 3. Calculating Harm Charges and Compensation

The second element of our proposed structure would require polluters to pay fully for any residual emissions that cannot feasibly be abated. As noted earlier, this commitment to *full compensation* is essential to spur pollution control innovation, ensure that companies take

*Science as Law and Proposed Changes in the Current Common Law Toxic Tort System*, 9 BUFF. ENV’T L.J. 35 (2001) (exploring potential compensation mechanisms and tradeoffs for victims involuntarily exposed to potentially harmful toxics); Albert C. Lin, *Beyond Tort: Compensating Victims of Environmental Toxic Injury*, 78 S. CAL. L. REV. 1439 (2005) (examining the weaknesses of the existing toxic torts framework of compensating victims).

<sup>83</sup> Food Quality Protection Act of 1996 (FQPA), Pub. L. No. 104-170, 110 Stat. 1489 (codified at 7 U.S.C. §§ 136–136y and 21 U.S.C. §§ 301–382) (implementing a safety standard for tolerance for pesticide chemical residue).

seriously their obligation to eliminate harmful emissions to the greatest extent *feasible*,<sup>84</sup> and meet the demands of environmental justice.

We note that setting the level of harm (or risk) charges and identifying those who should be compensated would require a new emphasis at the EPA on understanding the fate and transport of emissions – and evaluating the epidemiological and ecological harms they create. We anticipate that this new regulatory focus would require a shift in the human resource capabilities of the Agency toward more refined exposure assessment, increased epidemiological and ecological analysis as well as risk assessment and benefit-cost analytics.

#### 4. Who Receives the Required Compensation

The duty to pay compensation for environmental harms or risks raises another question: who should receive the charges levied? Current practice typically has fees paid going to the government whose legal framework imposes the charge. For example, the emissions allowance fees paid under the Regional Greenhouse Gas Initiative (RGGI) go to the compact of Northeastern states that make up the RGGI region – and are then redistributed to the individual states. For broad-based harms, such as acid rain or climate change, it perhaps makes sense for the funds to go to the governments on behalf of the affected public.

But we argue that if specific *victims* can be identified – especially for localized harms such as the air pollution from an incinerator – the compensatory charges should be paid by the beneficiaries to those bearing the burden of the pollution.<sup>85</sup> While the details of how to pay out

---

<sup>84</sup> We believe that informed consent by pollution victims and affirmative assent to compensation rather than further emissions reduction represents the best test of *full* internalization of the remaining pollution externality. But to avoid the well-documented risk of “holdouts,” we acknowledge that government calculation of the appropriate harm charge may be necessary. We remain open to the possibility that such a structure may not deliver the full compensation that we intend – and the system proposed will need to be further refined.

<sup>85</sup> Whether victims may collect both for the exposure to risk, and again if they actually suffer a disease resulting from the risk, is an issue to be decided under state law, but in some instances, states might decide to allow an offset against a damage verdict for the risk charges previously paid.

such compensation would require a methodological discussion beyond the scope of the present article, as we noted earlier, a “compensate victims if they can be identified” rule would go a considerable distance toward operationalizing *environmental justice* as a central principle of 21<sup>st</sup> Century environmental law.

#### IV. Our Principles Illustrated.

Experience under America’s environmental laws illustrate how the general principles outlined above should work in practice. As we have suggested elsewhere,<sup>86</sup> the drafters of our environmental laws in the 1970s recognized that they did not know exactly what would be the best approach to regulate environmental pollution. They therefore created a toolbox of legal authorities and approaches and left it to implementation and experimentation to work out which approaches worked best. Now, fifty years into modern environmental law at the national level in the United States, it is time to reflect on this experience and ask what has worked well and what has not,<sup>87</sup> an exercise that one of us has called “domestic comparative law.”<sup>88</sup>

One of the basic lessons to be learned is that drafters of environmental laws should pay greater attention to the *incentives* they create.<sup>89</sup> Many U.S. environmental statutes have been interpreted to put the burden of proof on the government to show that a practice is causing harm

ESTY, *ADVANCED INTRODUCTION TO U.S. ENVIRONMENTAL LAW*, London: Elgar (forthcoming 2021).

or, in other circumstances, that the benefits of regulation exceed the costs or at least that the proposed rules would be cost-effective. This structure of regulation, however, encourages those who wish to avoid the costs of regulation to create “paralysis by analysis,” studying a problem to death as a way of avoiding or at least postponing regulation. This problem has been brilliantly addressed by David Roe, the principal drafter of California’s Proposition 65, in an article that has not received sufficient attention.<sup>90</sup> We anticipate that our *end of externalities* approach with its insistence on fully compensatory harm charges for residual emissions would provide similar incentives to clarify the facts and innovate to reduce pollution.

This brief article is not the place to outline comprehensively the changes to existing law and regulatory policies needed to implement our vision of an environmental law dedicated to internalizing externalities, but in the paragraphs that follow we illustrate briefly each of three governing principles we highlighted at the outset of Part III.

**(1) Regulate to Eliminate or Reduce Harmful Pollution to the Extent Technically Feasible and Economically Practical.** We believe that the existing system of “command and control” regulation in which government imposes mandatory pollution reduction obligations should be supplemented with a new principle that *no harmful emissions* should be the goal and that all residual pollution harms, after what is technologically feasible has been abated, be subject to a compensation obligation as discussed in the next section.

**(2) Impose Emissions Charges to Compensate Victims of Residual Risks Remaining After the Application of Feasible Technology and to Create Incentives to Develop Better Pollution Controls.** For the reasons described above, we believe that “harm charges” should be

---

<sup>90</sup> David Roe, *Barking Up the Right Tree: Recent Progress in Focusing the Toxics Issue*, 13 COLUM. J. ENV’T L. 275 (1988) (an economic incentive analysis of Proposition 65 by its author which claims that it is successful because it removes incentives for industry to delay regulation).

imposed on a routine basis to compensate victims for the harms to others that regulators determine cannot feasibly be eliminated .

A good example of why this is necessary is provided by the wealthy municipalities in Connecticut and New York that periodically discharge untreated sewage from their antiquated sewer systems into Long Island Sound. These releases result in beach closings and other damages to natural resources, and possibly risks to human health.<sup>91</sup> But the municipalities currently bear little cost for the harm they have caused and thus have insufficient incentives to upgrade their underperforming sewer systems which are the root cause of the problem.

Congress legislated what could have been the beginning of harm charges for residual pollution in Section 185 of the Clean Air Act Amendments of 1990.<sup>92</sup> That section, which is still on the books, provides for emission fees on major sources of air pollution located in severely polluted areas that are violating the national air quality standards. To the present day, however, EPA has declined to implement it.<sup>93</sup> In fairness, much of the pollution in the areas with the most severe air quality problems, such as the Northeast, comes in from out of state, so imposing charges on local industry would not put pressure on those responsible.<sup>94</sup> While providing a mechanism for harm charges, Section 185 was mistaken in focusing on major sources *located in*

<sup>92</sup> Clean Air Act §185, 42 U.S.C. § 7511d.

<sup>93</sup> Fourteen years after its enactment, EPA purported to “waive” the fee requirement for emissions charges in severely polluted non-attainment areas, 69 *Fed. Reg.* 23951 (April 30, 2004), but it was sued and ordered to comply with the law in *South Coast Air Quality Management District v. EPA*, 472 F.3d 882 (D.C. Cir. 2006). Since that time, EPA has grudgingly applied the law, while still trying to give states as much flexibility as it can to disregard that part of the law thru “an equivalent alternative program” such as requiring more low emission vehicles (LEVs) rather than imposing emission charges. See [https://www.epa.gov/sites/production/files/2015-09/documents/1hour\\_ozone\\_nonattainment\\_guidance.pdf](https://www.epa.gov/sites/production/files/2015-09/documents/1hour_ozone_nonattainment_guidance.pdf).

<sup>94</sup> Sarah E. Light, *Precautionary Federalism and the Sharing Economy*, 66 EMORY L.J. 333, 353 (2017) (exploring that market failures that surface when “decentralized actors set environmental standards” resulting in out of state pollution); see also Henry N. Butler & Jonathan R. Macey, *Externalities and the Matching Principle: The Case for Reallocating Environmental Regulatory Authority*, 14 YALE L. & POL’Y REV. 23, 56 (1996).

non-attainment areas rather than on the out-of-state sources that were actually causing most of the problem.<sup>95</sup> But the idea of charging polluters for their remaining emissions after pollution controls have been put in place makes sense to create incentives for continuous improvement and innovation.

**(3) Disclose Emissions Volumes and Risk for Significant Discharges to the Environment Not Currently Known to be Harmful.** A recurrent lesson in environmental law is that pollution thought not to be harmful at one point in time, sometimes later turns out to be more harmful than originally recognized.<sup>96</sup> A good example is lead, which was used in the past as a gasoline additive to increase octane and prevent engine knocking. At the time lead in gasoline became an issue in the 1970s, lead was thought to be harmful only in concentrations greater than 50 micrograms per deciliter of blood.<sup>97</sup> Today, as larger epidemiological studies have been conducted, we see adverse effects such as damage to cognitive function in children at levels a tenth or less of what used to be considered “safe.”<sup>98</sup> In other examples, preliminary warning signs, such as “subclinical effects” – changes to bodily functions that are not in and of themselves harmful – or animal data at high doses that may (or may not) turn out to be harbingers of more serious problems.<sup>99</sup>

<sup>99</sup> See, e.g., George D. Thurston et al., *A Joint ERS/ATS Policy Statement: What Constitutes an Adverse Health Effect of Air Pollution? An Analytical Framework*, 49 EUROPEAN RESPIRATORY J. 13 (2017) (“Alternatively, adverse

In these situations, the U.S. legal system generally finds it difficult to regulate pollution. The issue is not so much the terms of substantive environmental statutes, which are often precautionary in their stated goals, but rather the background norms of judicial review. Historically, Americans are more suspicious of governmental action than the citizens in some other countries, and as a result, we have generally placed a burden on the government to show that there is a reasonable basis for its actions in court.<sup>100</sup> For example, the 1976 Toxic Substances Control Act aspired to place the burden of proof on manufacturers of new chemical substances to show that they were safe before they were distributed in commerce and released into the environment.<sup>101</sup> Nevertheless, the courts held that the burden lies with EPA to show a need for testing before approving a new chemical. As a result, according to a 2003 study, 67% of applications for approval of new chemicals included no test data and 85% included no health data but about 90% of such applications to distribute new chemicals in commerce were approved.<sup>102</sup>

---

CNS health effects from air pollution may be secondary to systemic impacts mediated by other body systems. Subclinical and clinical cardiovascular and metabolic disease are established risk factors for cognitive decline and dementia [142], and it is likely that at least part of the observed impact of air pollutants on cognitive disease risk occurs as a result of air pollution-induced ischaemic effects.”)

<sup>100</sup> See generally Gail Charnley & E. Donald Elliott, *Risk Versus Precaution: Environmental Law and Public Health Protection*, 32 ENVTL L. REP. 10363 (Mar., 2002) (“The precautionary principle is based on the idea that it is better to be safe than sorry; that is, precaution reflects the need to take action in the face of potentially serious risks without awaiting the results of scientific research that establishes cause-and-effect relationships with full scientific certainty. In contrast, U.S. law reflects a traditional suspicion of government regulation, requiring extensive actual records proving “significant risks” to justify regulation aimed at protecting public health from environmental contaminants. This fundamental norm of the U.S. legal culture, sometimes called the “principal of legality,” makes precautionary environmental health regulation difficult because government must assemble a factual record to support its actions.” (citations omitted)).

<sup>101</sup> See generally Ortwin Renn & E. Donald Elliott, *Precautionary Regulation of Chemicals in the US and EU in THE REALITY OF PRECAUTION: COMPARING RISK REGULATION IN THE UNITED STATES AND EUROPE* 223–56 (eds. Jonathan B. Wiener, Michael D. Rogers, James K. Hammitt & Peter H. Sand, RFF Press, 2011) (quoting “[i]t is the policy of the United States that . . . adequate data should be developed with respect to the effect of chemical substances and mixtures on health and the environment and that the development of such data should be the responsibility of those who manufacture and those who process such chemical substances and mixtures” 15 U.S.C. § 2601(b)(1)).

<sup>102</sup> *Id.*, citing Batelle, *Overview: Office Of Pollution Prevention And Toxics Programs* (Batelle: Columbus, Ohio, Dec. 24, 2003), <http://chemicalspolicy.org/downloads/TSCA10112-24-03.pdf> For a description of the techniques EPA uses to review the safety of new chemicals in lieu of testing see Renn & Elliott, *supra* note 102.

Our solution to this problem is mandatory disclosure. If too little scientific evidence is available to justify regulation, at a minimum, those who are releasing significant amounts of substances beyond their property's boundaries should be required to disclose publicly: (1) the volume of the releases, and (2) what scientific research leads them to believe that the releases will not be harmful to others. The underpinnings of such a rule have been demonstrated in practice since the 1980s when California adopted Proposition 65 and required those putting products into the marketplace that contain chemicals causing a risk of carcinogenicity or reproductive harm to disclose these potential harms.<sup>103</sup>

More generally, since the 1960 *Restatement of Torts*, manufacturers have had an obligation to test their products to confirm that they were safe before releasing them to the public.<sup>104</sup> In practice, this often consists primarily of conducting a review of the existing scientific literature.<sup>105</sup> We believe that polluters should have a comparable legal obligation to conduct reasonable testing and literature review to verify that the materials that they release into the environment will not harm others. It is arguable that they already do have such an obligation under the *Restatement of Torts* cited above because the pollution that accompanies the manufacture of a useful product or service is arguably a co-product; in any event, for the same policy reasons that the producer of a product has an obligation to assure that it is safe before

putting the product into the marketplace, the producer of pollution should be obligated to do the same.

Some of the quiet successes of environmental law – the Toxics Release Inventory<sup>106</sup> and discharge monitoring reports under the Clean Water Act<sup>107</sup> – already rely on disclosure obligations, which not only inform the government and the public but also put pressure on polluters to reduce their discharges to the extent feasible.<sup>108</sup> The key weakness in these existing environmental disclosure programs is that they only apply to substances that are already known to be hazardous.<sup>109</sup> We believe that similar disclosure obligations should be extended to substances that are released in significant quantities to the environment even if they are not yet regulated or known to be hazardous. Admittedly, what is “significant” can vary and may be contentious. So as the EU’s REACH program<sup>110</sup> to test chemicals provided, we propose that disclosure be phased in starting with substances released in large volumes and gradually encompassing lower trigger thresholds.<sup>111</sup> Volume by weight released to the environment is not

<sup>110</sup> For a summary, see generally European Commission, REACH in Brief (October 2007) [http://ec.europa.eu/environment/chemicals/reach/pdf/2007\\_02\\_reach\\_in\\_brief.pdf](http://ec.europa.eu/environment/chemicals/reach/pdf/2007_02_reach_in_brief.pdf),

<sup>111</sup> See generally *Do I reach the one tonne a year threshold?*, EUROPEAN CHEMICALS AGENCY, <https://echa.europa.eu/support/registration/your-registration-obligations/do-i-reach-the-one-tonne-a-year-threshold>. At a November 14, 2019 Conference (“Toward 21<sup>st</sup> Century Environmental Protection: Policies, Technologies, and Institutions”) co-hosted by the Yale Center for Environmental Law and Policy and the American University’s Center for Environmental Policy, former DuPont chief sustainability officer and acting EPA Administrator Linda Fisher objected to an earlier version of our proposal by noting that industry can detect releases as low as one part per trillion. We agree that disclosure should focus first on exposure at a scale where harm from the emissions seems more likely.

an ideal proxy for potential risks of chemical exposure, but it is a good place to start as a matter of administrative practicality and as better techniques for prioritizing chemicals for review are developed, they can gradually be integrated into the system.<sup>112</sup>

Disclosure of release volumes and summaries of data showing that the material is or is not harmful to others might further be required by the Securities and Exchange Commission (SEC) as part of corporate annual financial reporting.<sup>113</sup> We recognize that the SEC conceives of its primary role as protecting investors, although we note that, in fact, the 1969 National Environmental Policy Act contains a “super-mandate” making protecting the environment part of the mission of every agency of the federal government.<sup>114</sup> In any event, in light of some companies paying hundreds of millions of dollars to settle cases for disposal of substances that they maintain that they thought were not hazardous,<sup>115</sup> disclosure of large releases and the science relating to their propensity to harm others can arguably be justified under the SEC’s usual tests for what information should be disclosed.<sup>116</sup> However, a specific interpretation issued by the SEC or the accounting profession for what information must be disclosed about releases of potentially harmful substances into the environment would be helpful; it would speed

<sup>116</sup> For a good summary of the SEC’s current disclosure rules in the context of climate change, see Roshaan Wasim, *Corporate (Non)Disclosure of Climate Change Information*, 119 Colum.L.Rev.1311, 1322-1332 (2019), [https://www.columbialawreview.org/wp-content/uploads/2019/06/Wasim-CORPORATE\\_NONDISCLOSURE\\_OF\\_CLIMATE\\_CHANGE\\_INFORMATION.pdf](https://www.columbialawreview.org/wp-content/uploads/2019/06/Wasim-CORPORATE_NONDISCLOSURE_OF_CLIMATE_CHANGE_INFORMATION.pdf)

compliance rather than leaving clarification of the issue to litigation. Such disclosures can be helpful not only to potential investors but also to alert government agencies and independent scientific researchers that significant populations are being exposed to pollutants with only a weak scientific basis to conclude that they are not hazardous, thus spurring additional research.

## V. Conclusion

We think it is time to undergird environmental law with a new foundation in environmental rights and thus with a principle that all negative externalities should be eliminated or reduced to the extent feasible -- and that any remaining pollution be paid for through a structure of compensatory harm charges. We believe the philosophical logic for such a principle comports with modern public sentiment and the emerging consensus that a fundamental human right to a healthy environment exists and should be recognized and protected to the maximum extent possible. The fact that our “no externalities” principle tracks changing attitudes in the corporate world where *shareholder primacy* (and a belief that the mission of a corporation is to deliver maximum returns to its owners<sup>117</sup>) has given way to a new spirit of *stakeholder responsibility* and reimagined *capitalism* offers further support for the claim that our proposal captures changing societal norms.<sup>118</sup>

We leave the precise contours of how environmental regulation would need to be recast to advance a “no externalities” principle to another day. We recognize that significant issues related to tracking emissions, identifying those affected by pollution, valuing impacts, calculating harm charges, assessing risks based on potential future harms, and determining who

---

<sup>117</sup> See, e.g., BUSINESS ROUNDTABLE, *supra* note 22; REBECCA HENDERSON, REIMAGINING CAPITALISM IN A WORLD ON FIRE (2020).

<sup>118</sup> Henderson *supra*; Daniel C. Esty, *Creating Investment-Grade Corporate Sustainability Metrics in VALUES AT WORK: SUSTAINABLE INVESTING AND ESG METRICS* (Daniel C. Esty & Todd Cort, eds., New York: Palgrave Macmillan, 2020) (arguing that business models which depend on externalizing costs onto society – whether in the form of pollution or inadequate wages that leave workers dependent on social safety nets – will be ever more difficult to sustain in the years ahead; Henderson, *supra* note 121).

should receive compensation need to be worked out. But we think the time is right to extend the work of Dick Stewart and his generation -- and begin the shift beyond government-defined “command and control” mandates and technology-based standards based on benefit-cost analysis to a more just system of environmental law and policy dedicated to internalizing all environmental externalities.
